

**THE
CORING
COMPANY**

The Coring Company presents new product for the mining industry at **bauma2022**

Mo i Rana, October 2022 - The Coring Company (TCC) is a Norwegian technology company developing digital solutions for the construction- and mining industry. Earlier this year the company launched its new product, **Sample Control System (SCS)** and through its solution «**SCS Construction**», TCC is providing a powerful tool to reduce costs and the CO2 footprint of ground investigations within the building- and construction sector.

The Coring Company is now developing «**SCS Mining**», a solution adapted to the mining industry, and we will at Bauma 2022 (www.bauma.de) offer a preview of a new concept consisting of a software/hardware solution that can give miners unique leverage. The solution, particularly targeting underground mines, facilitates digital transformation in the industry and represents a powerful tool for better control and utilization of own data, giving the possibility of improved yield through optimization of resource models.

Founder of The Coring Company, Frida Vonstad (PhD in Geotechnics from University College London / UCL) has used her experience from operational field work to develop SCS;

- We aim to solve one of the major challenges within the mining industry. Our concept for sampling, data analysis and optimization will contribute to increased accuracy in the geological models that miners are using today and give better insight into what the individual sources of ores provides in terms of resources.

Meet us in the Mining hall (C2) at Bauma 2022, stand no 148, or contact us on e-mail (mail@thecoring.com) to learn more about «SCS Mining» and «SCS Construction».

About The Coring Company (TCC)

TCC provide solutions that optimize and digitize procedures used in field work in construction, ground investigations and mining. Utilizing data from drilling, samples and industrial experience, the TCC solutions provide a much more detailed analysis with reduced sample materials. TCC will offer services within Software (SaaS), AI, hardware, data analysis and robotics. Our ambition is to create cost- and time-efficient solutions that reduce CO2 emissions, obtain increased yield and resource utilization through better utilization of own data.
